Evidence and recovery decisions

1. **Versioned artifacts**
   Code + data + provenance
2. **Check the instance and model**
   Data contracts and requirement evidence
3. **Preflight + solve**
   HiGHS feasibility; bounded annealing
4. **Evaluate and deliver**
   Original constraints, objective and source

Validate before activation

Repair data or model
Schema mismatch → revisit modelling
Wrong filters or joins → revisit preparation
Bounds and fixed user settings are protected.

Proven infeasibility
Return a diagnosis; do not submit to annealing.
A timed-out preflight remains unknown.

Use a validated baseline
If annealing is infeasible or materially worse, report the conventional solution and its source.

A failed solver run alone does not justify changing the request.

Repairs and solver calls share a finite budget.
